

# CAUTION

Your Stainless Steel Slide has been machined from a pre-heat treated forging of 416 Stainless for maximum durability. However, Stainless Steel slides require extreme care during the fitting process, to avoid breaking off the small tab of metal behind the safety notch.

Do not force the slide on to the frame. Break the sharp edges of the frame rails; remove excess metal from frame rails, Polish or stone the interior slide track.

If the slide becomes stuck to the frame remove it by carefully tapping the rear of the slide, for example, with a leather mallet, do not wiggle or pull the slide from the front in an attempt to free it, because it will cause the small tab behind the safety catch notch to break.

**CASPIAN WILL NOT REPLACE SLIDES IN WHICH THE  
TABS IN QUESTION HAVE BROKEN OFF.**
